

Data Analysis Report

Introduction :

This report has been prepared to explain several aspects of data analysis to stakeholders. It outlines each objective of the analysis, the methods used, the analysis visualizations in the form of charts, and the insights or findings from the analysis.

1. Sales Performance Analysis

1.1 Sales Trend:

- Objective:
To analyze the overall sales performance over time and identify trends, patterns, and potential seasonality in sales transactions from 2020 to 2022.
- Method:
Sales trend analysis was conducted by aggregating total transaction values (TotalOrderTransaction) on a monthly basis. The data was grouped by year and month to observe both overall trends and year-to-year comparisons.
- Visualization:

A. Sales Trend from 2020 – 2022

sales trend chart (2020–2022)

B. Seasonality per month multi-line chart

Seasonality per month from 2020 - 2022

- Insight & Findings:
 - o Sales performance shows fluctuations over the observed period, indicating that revenue is not consistent month to month. There are several peaks and drops, suggesting dynamic business activity.
 - o In Seasonality pattern, there are recurring peaks in certain months, particularly around April, October and November, that indicate potential seasonal demand or promotional periods
 - o Sales tend to decline around July – September, suggesting a possible low demand period or operational & sales team performance slowdown
 - o Sales Performance across 2020 – 2022 showing strong peaks in certain months, while 2021 appears more volatile with sharper declines.

1.2 Sales Growth Analysis:

- Objective:

To analyze and measure month-over-month sales growth from 2020 to 2022 in order to evaluate business performance trends and identify periods of significant increase or decline in sales transactions.
- Method:

Growth analysis was conducted by compare actual and previous month then deduct actual month with previous month and divide by previous month. Also this method using to calculate growth by Year on year.

- Visualization:

- Insight & Findings:

- Month over Month grow chart show high fluctuations in sales performance across the periods

- Several month experience positive growth, while other periods showed declines
- It also indicate sales performance is unstable and potentially influenced by seasonal demand, promotional activities, or market conditions.
- For Year over Year sales performance decrease by approximately 17.21% from 2020 to 2021
- However, sales slightly recovered in 2022 with a positive growth of 1.93% compared to 2021.
- The results indicate that business experience for 2020 – 2021 against 2021 – 2022 has contraction trend.

1.3 Average of Orders:

- Objective:
To give description about total number transaction and revenue each year, and also to measure average revenue generated per transaction from 2020 to 2022.
- Method:
To get AOV, need calculate Total Revenue divide by Total Transactions. The calculation also was performed for the overall 3 year period to identify changes in transaction value trends over time.
- Visualization:

Summary Average of Order

Year	Revenue	Total Transaction	AOV(Average Order)
2020	Rp111.070.848.160,00	355	Rp312.875.628,62
2021	Rp91.960.394.232,00	326	Rp282.087.098,87
2022	Rp93.738.658.411,00	347	Rp270.140.225,97
Total 2020 - 2022	Rp296.769.900.803,00	1028	Rp288.686.673,93

- Insight & Findings:
 - From the table show that total revenue approximately Rp. 296 billion from 1028 transactions during 2020 – 2022.
 - Overall AOV during 3 year period was approximately Rp. 288 million per transaction.
 - AOV show declining from 2020 to 2022.
 - Although total transactions slightly recovered in 2022, average value per order continued to decrease
 - This indicates that customers were making more lower-value transactions, suggesting a shift toward smaller order sizes or reduced purchasing volume per transaction.
 - Declining AOV may indicate:
 - Average of customers are purchasing in smaller quantities.
 - Increased sales from lower price products
 - Contribution from high priced product decreased continuously.

1.4 Sales Distribution Analysis:

- Objective:

To analyze the distribution pattern of sales transaction and identify whether the revenue was come from small amount transactions or large amount transactions. Also this analysis aims to detect outliers for data condition, and evaluate variability for all transactions.

- Method:

Theres 2 method that use to analyze sales distribution. First using histogram to visualize frequency distribution of data TotalOrderTransaction by the amount Rupiah per transaction. It will help identify variability of transactions and spot behaviour pattern.

2nd method we use IQR method to analyze outliers and visualize that with boxplot. This will help us to analyze with some statistic calculations such as data spread, median, quartiles, and outliers. Specifically, when use IQR method, that will use Interquartile Range (IQR) method and use lower or upper bound:

$$\text{IQR} = Q3 - Q1$$

$$\text{Lower Bound} = Q1 - 1.5(\text{IQR})$$

$$\text{Upper Bound} = Q3 + 1.5(\text{IQR})$$

Transactions outside the upper or lower bound are categorized as outliers.

- Visualization:

Sales Distribution Histogram

- Insight & Findings:

The histogram shows a right skewed distribution, where most transactions are concentrated in lower transaction ranges, while only a small number of transactions reach very high values

This indicates:

1. Sales revenue generate from low to medium value transactions
2. Several large transactions contribute significant to overall revenue
3. Transaction frequency decreases as transaction value increases

For boxplot show average transaction relative low transaction value. The distribution spread quite wide indicate high variability. Also from analysis, there is outliers may indicate high value customer make transaction, probably large company.

2. Product & Category Analysis

2.1 Category Performance & Contribution Overview

- Objective:

To identify which product categories contribute the most to company sales performance.

- Method:

Category performance analysis was conducted by grouping transaction data based on product category and aggregating several key business metrics:

- Total Revenue by Category→ calculated using the sum of ItemTotal for each category.
- Total Orders by Category→ calculated using the count of transaction orders within each category.
- Quantity Sold by Category→ calculated using the sum of product quantity sold for each category.

Additionally, revenue contribution percentage analysis was performed to measure how much each category contributed to overall company revenue.

- Visualization:

Category Performance by Revenue Column Char

Category Performance by Orders Column Chart

Category Performance by Quantity Orders Bar Chart

Revenue Contribution by Product Category

Revenue Contribution by Product and Category Treemap

- Insight & Findings:
 - o For Revenue :

The Bicycle category generated the highest revenue contribution, accounting for approximately 37.00% of total company revenue during

2020–2022. This was followed by Gym & Fitness (28.35%) and Golf (23.26%).

These results indicate that sports mobility and fitness-related products were the primary revenue drivers for the company. Meanwhile, categories such as Outdoor Sport, Futsal, Fishing Equipment, and Basketball contributed relatively low revenue percentages, each below 3% of total revenue contribution.

- For Order & Quantity Analysis:

Although Gym & Fitness did not generate the highest revenue, the category recorded the highest number of quantity orders, indicating strong customer demand and high purchase frequency.

This suggests that:

- Gym & Fitness products are purchased more frequently,
- while Bicycle products generate higher revenue per transaction due to higher product prices.

Briefly, company's sales performance was heavily concentrated in three main categories:

- Bicycle
- Gym & Fitness
- Golf

These categories contributed the majority of total sales revenue, showing that customer demand was strongly focused on fitness and sports-related products.

Lower-performing categories may require:

- product strategy evaluation,
- promotional optimization,
- or inventory reassessment to improve sales contribution.

2.2 Top Products within Categories

- Objective:

To identify the highest performing products within each product category based on total revenue contribution during the 2020 – 2022 sales period.

- Method:

Product performance analysis was conducted by grouping transaction data based on Product Category and Product Name. Revenue contribution for each product was calculated using the sum of ItemTotal.

The analysis then ranked products based on total revenue to identify the top-performing products across categories.

A Top N filtering method was applied to display the five products with the highest revenue contribution.

- Visualization:

Top 5 Products by Revenue Bar Chart

- Insight & Findings:

From the analysis showed that Road Bike was the highest performing product, generating approximately Rp.78,19 billion in revenue, significantly outperforming other products.

Other strong-performing products included:

- Stick Golf Bag
- Bench Press
- Treadmill
- Mountain Bike

The findings indicate that:

- Premium sports equipment and fitness- related products generated the largest sales contribution
- While bicycle-related products dominated overall product revenue performance

This suggest that the company revenue performance was highly influenced by several flagship products with strong market demand and high transaction value.

2.3 Product Demand Analysis

- Objective:

To analyze product demand distribution and purchasing behaviour based on quantity ordered across products during 2020 – 2022 sales period.

The analysis aims to identify:

- Products with high customer demand
- Purchasing volume distribution
- Variability of quantity orders between products.

- Method:

This analysis was conducted using Quantity Orders metric aggregated by Product Name.

Several statistical distribution analyses were applied:

- Histogram Analysis
 - Used to analyze frequency distribution of quantity orders per transaction
- Boxplot Analysis
 - Used to evaluate quantity variability, spread, median distribution, and potential outliers across products.

Analysis focused on understanding whether customer purchases were concentrated within certain quantity ranges or evenly distributed across products.

- Visualization:

Distribution Volume of Quantity Order

Quantity Orders Variability Analysis by Product

- **Insight & Findings:**
From analysis indicates that transaction was relatively stable and consistently distributed across medium purchase volumes. Transactions with extremely high quantity orders were less frequent, suggesting that bulk purchasing activity occurred only occasionally.

The boxplot analysis indicates that most products shared relatively similar quantity distribution ranges, with median quantities concentrated around the middle range.

Several products such as:

- Heavy Bag,
- Bench Press,
- Road Bike,
- and Pull Up Bar

These showed relatively higher quantity variability, indicating fluctuating customer demand over time. Meanwhile, products with narrower box ranges demonstrated more stable.

2.4 Product Trend Analysis(Realistic vs Optimistic Forecast)

- **Objective:**
To analyze sales trends, seasonality patterns, and future revenue potential of top-performing products during 2020 – 2022 sales period.

The analysis aims to identify:

- Products with stable or fluctuating sales performance
- Monthly seasonal demand patterns
- Possible future revenue scenarios for strategic business planning.

- Method:
This analysis was conducted by aggregating monthly sales revenue for top 5 products based on total revenue contribution.

This analysis was divided into two approaches:

- Historical Product Trend Analysis
Monthly sales revenue for each top product was compared using a multi-line chart to observe:
 - Sales movement trends,
 - Seasonality patterns,
 - Demand fluctuations over time
- Forecast Scenario Analysis
This analysis was performed using historical revenue trends from 2020 – 2022 to estimate possible revenue performance for 2023 – 2025 under 2 scenarios:
 - Realistic Forecast
Assumes current declining trends continue based on historical performance.
 - Optimistic Forecast
Assumes sales recovery and moderate growth improvement in future periods.

- Visualization:

Monthly Sales by Top 5 Products

Realistic Revenue Forecast 2023 – 2025

Optimistic Revenue Forecast 2023 - 2025

- **Insight & Findings:**

The analysis shows that Road Bike consistently generated highest monthly revenue among all products, despite experiencing several fluctuations throughout the year. Product such as Stick Golf Bag, Bench Press, Treadmill.

From realistic forecast scenario indicates that most products may experience:

- Stable to declining revenue trends,
- Especially for products highly dependent on seasonal demand.

Road Bike remains the strongest revenue, although this projected revenue gradually decrease toward 2025.

From optimistic forecast, this analysis find several things, such as:

- Several products show potential revenue stabilization and gradual growth,
- Particularly Road Bike and Stick Golf Bag.

2.5 High and Low Performance Category & Products

- Objective:

This analysis to identify top and bottom performers at both product and category levels, and provide actionable insights to guide inventory allocation, marketing campaign reference and strategic decision making.

- Method:

This analysis is based on aggregated revenue data (in billions of Rupiah) from 2020 to 2022 by Products and Categories of Product. The performance was evaluated purely on total revenue contribution.

- Visualization:

For High Performance 5 Category vs Low Performance 5 Category

Top 5 Category from 2020 – 2022 Bar Chart

Low 5 Category from 2020 – 2022 Bar Chart

For High Performance 5 Product vs Low Performance 5 Product:

Top 10 Products by Revenue from 2020 – 2022 Bar Chart

Low 10 Products by Revenue from 2020 – 2022 Bar Chart

- **Insight & Findings:**

- Three categories (Bicycle + Gym & Fitness + Golf) dominate the market, contributing the vast majority of revenue.
- Products generating less than Rp3 billion (e.g., Fishing soft lure Rp0.25 billion, Abs Roller Rp1.61 billion, Tracking Pole Rp1.69 billion) show very low market traction.
- There is a high concentration of revenue in a few categories and products. The top 3 categories represent the bulk of total revenue, while many niche products generate minimal returns.
- There is a clear performance gap between mainstream fitness/cycling/golf equipment and niche/outdoor specialty items.

3. Sales Team and Region Analys

3.1 Regional Performance Overview

- **Objective:**
To identify regional sales performance and revenue contribution across all operating regions.
- **Method:**
Regional Analysis was conducted by aggregating total revenue and calculate revenue contribution across regions based on sales order data from 2020 – 2022.
- **Visualization:**

Total Revenue by Region Bar Chart

Revenue Contribution Percentage by Region Treemap

- **Insight & Findings:**
The regional sales analysis revealed significant differences in revenue contribution across regions from 2020 to 2022.

Sulawesi, Maluku and North Maluku region generated highest revenue contribution, that indicating strong market performance and sales effectiveness. Meanwhile Sumatera & Kalimantan region contributed around 22.99%, making it second strongest sales performance.

On the other hand, Java and Bali, and region East & West Nusa Tenggara recorded lowest revenue contributions. This is potential opportunities for sales optimization, market expansion, and changing sales strategies.

Overall, There is dependency for regions that give high contribution for sales. So other low performing regions need penetration strategy to get more sales orders from low performance region.

3.2 Sales Team Performance & Trend Analysis

- **Objective:**
To evaluate sales team performance based on revenue generation and progress sales order transaction trend progress from 2020 – 2022.
- **Method:**
Sales team performance analysis was conducted using Pivot Table analysis by aggregating Total Revenue(TotalOrderTransaction) and Quantity Orders.
for each sales team during the 2020–2022 period.

Additionally, yearly revenue trends were analyzed using a multi-line chart to compare sales performance progression across all sales teams over time.

The analysis focused on:

- identifying the highest-performing sales teams,
- comparing transaction volume between teams,
- evaluating sales consistency and trend movement from year to year.
- **Visualization:**

Revenue by Sales Team Bar Chart

Sales Orders by Sales Team Column Chart

Yearly Revenue Trend by Sales Team Trend

- **Insight & Findings:**
There are significant differences in performance across sales team in term of both revenue contribution and sales order volume.

Sales region Sulawesi – Maluku Teams performance indicates strong market penetration and consistent sales productivity.

Sales Sumatera – Kalimantan Region Team ranked as the second strongest contributor in revenue and demonstrating stable sales performance across the 2020 – 2022 yearly period.

From trend analysis, most sales teams experienced a decline in revenue during 2021, followed by partial recovery or stabilization in 2022. However, the sales region Sulawesi – Maluku Team maintained relatively strong and stable performance throughout the entire period. Also in 2021 revenue was slowdown.

3.3 Sales Promotion Method Analysis

- Objective:
This analysis has goal to evaluate effectiveness of different sales promotion methods based on revenue contribution, prospect generation, and sales conversion efficiency.
- Method:
Sales promotion method analysis was conducted by grouping sales data based on promotion methods used, including:
 - Corporate Negotiate with Patnership Contract
 - Online Marketing only
 - Online Marketing with Corporate Negotiate and with Patnership Contract.

The analysis was measured:

- Total Revenue contribution
- Total Prospect contribution
- Revenue generated by per prospect for each promotion.

For Efficiency Analysis, the analysis was used Revenue per Prospect. For calculated Revenue per Prospect was using:

$$\text{Revenue per Prospect} = \text{Total Revenue} / \text{Total Prospect}.$$

- Visualization:

Revenue Contribution by Promotion Method Bar Chart

Prospect Contribution by Promotion Method Column Chart

Efficiency Analysis per Promotion Methods Bar Chart

- **Insight & Findings:**
The analysis revealed that the Corporate Negotiate with Partnership Contract method generated the highest revenue contribution, reaching approximately Rp.140.42 billion, making it most dominant sales promotion strategy during the 2020 – 2022 period.

Meanwhile, combined strategy of Online Marketing + Corporate Negotiate + Partnership Contract generated approximately Rp.104.18 billion in revenue, indicating that integrating multiple promotion approaches also contributed significantly to company sales performance.

From prospect analysis, method Corporate Negotiate with Partnership Contract method also generated highest number of prospects, total around 22 prospects, followed by combined promotion strategy with 18 prospects.

Efficiency analysis showed that the Corporate Negotiate / Partnership Contract method achieved the highest revenue generated per prospect, indicating superior sales conversion effectiveness and stronger prospect quality compared to other promotion methods.

In contrast, the Online Marketing method generated lower revenue efficiency per prospect, suggesting that while digital promotion may support broader customer reach, its conversion effectiveness was relatively lower than partnership-based sales strategies.

Overall, the findings indicate that partnership-oriented promotion methods played a more significant role in driving high-value sales performance compared to standalone online marketing strategies.

3.4 High & Low Performing Sales Teams

- Objective:
To identify the highest and lowest performing sales teams based on total revenue contribution during the 2020 – 2022 period, and evaluate performance gaps between sales teams.
- Method:
The analysis was conducted using Pivot Tables and bar chart visualizations in Excel.

Steps:

1. Grouped transaction data by SalesTeamName
2. Aggregated TotalOrderTransaction using SUM.
3. Ranked sales teams based on total revenue contribution,
4. Selected Top 3 sales teams as high performing teams, and Bottom 2 sales teams as low – performing teams.
5. Visualized the comparison using horizontal bar charts to highlight revenue differences clearly.

- Visualization:

Top Performing Sales Teams Bar Chart

Low Performing Sales Teams Bar Chart

- Insight & Findings:

High Performing Sales Teams achieved by Sales Region Sulawesi – Maluku Team achieved the highest revenue performance, generating approximately Rp.103,20 billion, making it strongest contributor all teams. Also followed by Sales Sumatera – Kalimantan Region Team and Online Sales Team.

Low Performing Sales Team was label for Sales Java Region Team and Sales Region Bali – Nusa Tenggara Team generated approximately Rp.37,22 billion.

So this gap performance team indicates regional market potential, customer demand, sales, execution effectiveness, and promotional strategy performance.

3.5 Sales Team Efficiency Analysis

- Objective:

To evaluate the efficiency of each sales team in converting prospects into revenue and sales orders.

This analysis aims to identify:

- which sales team generates the highest revenue per prospect,
- which team achieves the highest order conversion efficiency,
- and whether high prospect volume always leads to higher revenue performance.

- Method:

1. Revenue Per Prospect Analysis

Calculated by dividing total revenue by total prospect count for each sales team.

Formula:

$$\text{Revenue per Prospect} = \text{Total Revenue} / \text{Total Prospect}$$

Purpose:

- measure monetary effectiveness of prospect conversion.
- evaluate average revenue generate from each prospect opportunity.

2. Orders per Prospect Analysis

Calculated by dividing total quantity orders by total prospects.

Formula:

$$\text{Orders per Prospect} = \text{Quantity Orders} / \text{Total Prospect}$$

Purpose:

- evaluate operational sales productivity.
- identify which teams convert prospects into actual transactions more efficiently.

3. Purpose:

Scatter plot analysis was used to compare:

- Total prospects,
- Generated revenue

Purpose:

- Determine whether larger prospect volumes correlate with higher revenue
- Identify highly efficient teams despite lower prospects counts.

- Visualization:

Revenue per Prospect by Sales Team

Prospect vs Revenue for Sales Team Region Scatter Plot

Orders per Prospect by Sales Team Column Chart

- Insight & Findings:

1. Sales Sumatera and Kalimantan Region team showed the highest efficiency

This team generated the most efficient sales team overall despite having only 6 prospects. That indicates:

- Highly targeted prospect acquisition,
- Strong conversion capability,
- Effective regional sales execution.

2. Sales Sulawesi and Maluku Team generated the highest total revenue.

This team achieved highest total revenue approximately Rp.103,2 billion with 16 Partner Store prospect.

However, its efficiency ratio was lower than the Sumatera and Kalimantan team, suggesting:

- Strong market coverage,
- But lower revenue generation per individual prospect.

3. Sales Region Bali and Nusa Tenggara team showed the lowest efficiency

Despite having 12 prospects, the team only generated:

- Approximately Rp.3,10 billion revenue per prospect,
- Lowest orders per prospect

This may indicate:

- Lower market conversion effectiveness
- Weaker demand generation,
- Or operational inefficiencies within sales process.

4. Higher prospect volume does not always guarantee higher efficiency

From scatter plot demonstrated that:

- Some teams achieved higher revenue with fewer prospects
- While others required larger prospect volumes to generate comparable revenue.

This suggests that:

- Prospect quality,
- Targeting strategy,
- Sales execution capability are more important than prospect.

5. Operational productivity varies significantly across teams

The gap between highest and lowest orders per prospect values indicates uneven sales productivity among teams.

This insight can support:

- Performance benchmarking,
- Sales training allocation,
- Regional strategy optimization.

4. Partner Store and transaction behaviour

4.1 Partner Store Contribution Analysis

- **Objective:**
To identify which partner stores that generate most high revenue for Company from 2023 until 2025
- **Method:**
The analysis was conducted by pivot Partner Store Name with Total Revenue per each Partner Store. Then the data was sorted descending by total revenue value and take only 10 partner stores that generate most high revenue.
- **Visualization:**

10 Partner Stores generate highest revenue bar chart

10 Partner Store revenue contribution percentage treemap

- **Insight & Findings:**
Partner Store Toko Hidup Sehat generated highest revenue for Company approximately Rp.9,43 billion and contribute approximately 3,18% revenue. Follow up by Sport Hub Medan and SportMania Store.

From 10 Partner Stores that contribute most revenue, each partner store was generate Rp.8 billion average from 2023 – 2025. Also, analysis showed that revenue contribution among the top partner stores was relatively well distributed, with no single customer dominating total company revenue. This is suggesting the presence of strong long-term business relationships.

4.2 Partner Store Loyalty & Repeat Transaction Analysis

- **Objective:**
To analyze customer loyalty and repeat purchasing behavior among partner stores. Also this analysis was done for compared partner store loyalty against revenue contribution.
- **Method:**
The analysis was conduct by pivot data Partner Store name and data SalesOrderID that already count aggregated from 2023 – 2025. Then data was sort descending and take top 10 highest count SalesOrderID.

After that data Partner Store Name was pivot by 2 value data Count SalesOrderID and Total Revenue to compare amount sales order and data total revenue that come from each partner store.

- **Visualization:**

Top 10 Partner Stores that mostly make repeat transaction bar chart

Total Revenue vs Repeat Transactions per Partner Store

- Insight & Findings:
 1. Several partner stores consistently performed repeat transactions between 24 – 27 orders during the 2020 – 2022 period.
 2. Mama Sport and Destination Sport Store recorded the highest repeat transaction frequency with 27 repeat orders each
 3. The transaction frequency looks stable across major partner stores.
 4. Relation between repeat transactions and total revenue was positive, that mean repeat orders from partner stores follow with high value total transaction.
 5. Most Partner Stores were concentrated within the medium to high revenue and repat transaction range, suggesting stable customer purchasing behaviour.

4.3 Partner Type Analysis

- Objective:
To compared type of Partner Store based on revenue contribution, transaction activity, and order quantity.
- Method:
The analysis was conducted by grouping customer transactions based on type of Partner Stores which are Distribution and Retail. Revenue contribution, transaction frequency, and quantity orders were aggregated and compared.

- Visualization:

Revenue Contribution by Partner Type Pie Chart

Sales Orders by Partner Type Column Chart

Quantity by Partner Type Bar Chart

- Insight & Findings:
 1. Retail type partner stores make most high revenue contribution for company.
 2. The gap revenue between 2 types was extreme large.
 3. Retail Partners was significantly generated larger quantity product.
 4. Distributor type remained relatively low across revenue, orders, quantity purchased.
 5. The distributor segment contributed a relatively small portion of revenue and transaction activity, suggesting lower market penetration and a more limited operational role within the current sales structure.

4.4 Top & Low Value Partner Stores

- Objective:
To identify high value and low value partner stores based on revenue contribution and transaction activity.
- Method:
The analysis was conducted by aggregating total revenue generated by each partner store during the 2020 – 2022 period. Partner store were ranked based on total revenue contribution, and Top/Bottom filtering methods were applied to identify highest and lowest contributing customers.
- Visualization:

High 10 Value Partner Stores generate high revenue

Low 10 Value Partner Stores generate low revenue

- **Insight & Findings:**
 1. The analysis revealed a substantial performance gap between high-value and low-value partner stores.
 2. Revenue contribution among top-performing stores remained relatively balanced, indicating a diversified customer portfolio structure with lower dependency on individual customers.
 3. In contrast, low-performing partner stores generated significantly smaller revenue contributions, ranging between Rp3 billion and Rp4.5 billion.

4.5 Regional Partner Store Distribution Analysis

- **Objective:**
This analysis conduct to analyze the geographic distribution of partner store revenue across regions and provinces, identify customer concentration areas, and understand how different partner types (Distributor vs Retail) contribute to sales performance in each region.
- **Method:**
For first analysis will be conduct to analyze revenue by region.
The method will be approach in this way:
 1. Create pivot table by use Region for rows and sum of total order transaction as value
 2. Calculate percentage contribution:

$$\text{Revenue contribution(\%)} = \frac{\text{Region Revenue}}{\text{Total Revenue}}$$
 3. Then data will be visualized by treemap.

Second analysis will be conduct to analyze revenue by province.

The method will be approach in this way:

1. Create pivot table by use province for rows and sum of total order transaction as value
2. Sort provinces by total revenue in descending order.
3. Visualize with horizontal bar chart

Third analysis will be conduct to analyze revenue by region and partner type. The method will approach in this way:

1. Create pivot table by use region as rows, Partner Type as columns, and sum of total order transaction as value
2. Compare revenue generated by Distributor and Retail.
3. Visualize data by using Stacked/Cluster bar chart.

- Visualization:

Revenue Contribution by Region Treemap

Revenue by Province Bar Chart

Region and Partner Type analysis by Revenue Contribution Cluster Bar Chart

- Insight & Findings:
 - Java dominates the customer base, contributing nearly 30% of total revenue, making it the company's primary market.
 - Kalimantan is the second-largest revenue contributor, generating almost one-fifth of total revenue.
 - Revenue is highly concentrated in a few strategic provinces, particularly Jakarta, which significantly outperforms other provinces.
 - The strong performance of Maluku and North Maluku indicates that eastern Indonesia represents a valuable market segment despite having fewer partner stores.
 - The company's business model is heavily dependent on Retail Partner Stores, which generate more than 90% of total revenue.
