Data Overview

Introduction

Background : XYZ Sport is a company focused on the sporting goods industry, founded in 2018. Their vision is to become the best-quality brand in the world of sports by providing high-quality equipment for sports enthusiasts in Indonesia.

Target Market & Marketing Strategy : XYZ Sport uses a multichannel marketing strategy to reach its customers. In addition to distributing sales through various retailers and distributors. The company maintains a strong online presence through social media and participates in various sponsorships and sporting events. Therefore, the company works with marketing agents such as online resellers and dropshippers.

Problem Statement & Business Objective

Problem Statement : Between 2020 until 2022, the company experienced a stagnation in sales revenue and a persistent, year-over-year decline. So the executive and stakeholders need breakdown and deep insight about the sales performance. Without identifying the root causes of the shrinking transaction sizes and regional performance gaps, the company cannot effectively allocate its marketing resources, optimize inventory, or adjust its sales strategies to drive profitable growth.

Objective 1 : Analyze Sales product related to Average Order Value (AOV)

Goal: Determine how different product categories, unit prices, and discount strategies are influencing the overall transaction size.

Focus: Identify which specific product categories drive the most revenue versus those that lower the AOV.

Objective 2 : Evaluate Regional and Sales Team Performance to Maximize Revenue

Goal: Assess the effectiveness of sales operations across regions and sales teams.

Focus: Pinpoint high-performing and underperforming regions. Analyze which sales promotion methods yield the highest return on investment to help reallocate resources effectively.

Objective 3 : Analyze Partner Store Behavior to Drive High-Value B2B Transactions

Goal: Understand purchasing patterns among B2B retail and distributor partners to encourage larger bulk orders.

Focus: Identify the most valuable partner stores based on their total revenue contribution and order frequency.

Data Overview

- **Core Transactions:** The database is centralized around the Sales Order table(using star schema), which records the transaction details and links directly to Order Items (specific products and quantities sold) and Invoices (billing, taxes, and shipping logistics).
- **Stakeholders:** The model tracks the key players involved in every sale by linking the transaction to the Patner Store (the B2B customers buying the goods) and the internal Sales Team (the staff managing the region and account).
- **Inventory & Supply:** The physical goods are managed through the Product table, which tracks stock levels, categories, and pricing. This is directly linked to the Vendor table to monitor the external suppliers providing those items.
